

Asset Management - Overview

Last Modified on 04/28/2023 10:17 am EDT

The Asset Management module utilizes Object Tracking to assign a unique identifying Object # to each asset. The Object # is customized for each client to enable multi-level reporting.

Setup of the Asset Object Type (including [Asset Sources](#)), associated Object Divisions, and Custom Information fields is handled by SGA as part of implementation.

After setup is complete, [Asset Additions](#) and [Asset Tasks](#) can be processed.

Transactions associated with each asset can be viewed under [Asset Transactions](#)

Asset activity is posted to the G/L via [Asset Entry Batches](#)
